# 1996 Journal Citation Reports® (JCR®)

## An Essential Journal Guide: Current, Comprehensive, Quantitative

The JCR is an essential, comprehensive, and unique guide to scientific and technical publishing. Essential because it reports current information on nearly 6,000 of the world's leading journals. Comprehensive because the JCR's coverage is both multidisciplinary and international. It includes virtually all specialties in science, technology, and the social sciences as well as over 3,000 publishers from 60 nations.

Most important, the JCR is unique because it is the *only* source of citation data on journals. This provides a new set of quantitative tools for ranking, evaluating, categorizing, and comparing journals.

## New Perspectives on Science Publishing

Citation data provide a unique view of primary research journals, one that is unobtrusive, quantitative, and objective. A citation is the formal acknowledgment of "intellectual debt" to previously published research, publicly recorded in the references listed by contemporary authors. That is, citations are an important indicator of how frequently current researchers are using the journal literature. By tabulating and aggregating citations, the JCR offers a unique perspective for journal evaluation and comparison.

## What the JCR Tells You

The JCR permits you to answer many important and fundamental questions about journals.

- **What are the largest journals?** The JCR conveniently ranks journals by the number of articles published in the current year. This lets you compare journals in terms of size and identify the small set of publications that typically accounts for the majority of articles in particular specialties or science overall.
- **What journals are most frequently used?** The JCR also ranks journals by the number of times they are cited in the current year. This tells you how often a journal was used—that is, formally referenced—by currently publishing researchers. Again, a small set typically accounts for the majority of citations.
- **What are the 'hottest' journals?** The JCR reports the average number of times a journal's current articles are cited in the same year they are published. This 'immediacy index' can indicate journals that are publishing the latest research in fast-moving specialties.
- **What journals have the highest impact?** The JCR also reports the average number of current citations to articles a journal published in the previous two years. This lets you compare a journal's 'impact factor' to the av-

---

verage impact for an appropriate set of peer publications or to the baseline for all JCR®-indexed journals.

- **What publications does a journal cite—and which cite it?** The JCR specifically identifies those publications most frequently cited by a particular journal. Conversely, it also shows which publications most often cited that journal. These citation links can reveal a journal's subject orientation, point to its closest peer or competitor publications, and describe specialty-specific networks of journals.

## Diverse Users, Multiple Uses

The information reported exclusively in the JCR permits seemingly endless applications for comparing journals, publishers, research specialties and fields, and nations. JCR information is used daily by a broad range of professionals for many different purposes, including:

- **Librarians**, to help manage journal collections, make journal acquisition and deselection decisions, and plan subscription budgets;
- **Editors**, to assess how well they are meeting editorial objectives, evaluate their current and long-term performance, and compare their standing with peers;
- **Publishers**, to monitor strategic data on competitors, identify opportunities for new journal launches, and decide whether to expand, merge or discontinue existing titles;
- **Authors**, to choose where to publish, discover new or foreign publications in their specialty, and select a 'shortlist' of journals to be scanned regularly for current awareness; and
- **Information Analysts**, to track major bibliometric trends in the research literature, develop new quantitative indicators of journal performance, and develop various models of scientific communications processes.

## How to Use the JCR

While the JCR is an essential and unique guide to scientific and technical journals, it should not be relied on as the *sole* source of information when comparing and evaluating publications. The quantitative citation data it reports are intended to complement, not replace, traditional qualitative and subjective inputs, such as peer surveys and specialist opinions.

Users should be aware of general citation patterns when applying the information in the JCR. For example, citation frequency, impact, immediacy, and other indicators may vary widely between different research specialties. In some fields, five-year impact factors may be more appropriate than the two-year impact data presented in the JCR. Also, review articles (and review journals) tend to be cited more frequently than other types of research communications. On the other hand, letters and other shorter communications may be cited less. In addition, journals publishing in non-English languages or using non-Roman alphabets may be less accessible to researchers worldwide, which can influence their citation.

We encourage JCR users to become fully aware of the information provided here, especially the definition of terms and description of how the JCR is compiled. We also invite you contact the Institute for Scientific Information, Inc.® if you have any questions about the JCR.

---

## How the JCR® is Compiled

Although the *Science Citation Index®* (SCI®) JCR provides citation data on science journals, it is compiled from the complete ISI® database, including cites processed for the *Social Sciences Citation Index®* (SSCI®) and *Arts & Humanities Citation Index®* (A&HCI®) as well as the SCI database. Citations to journals listed in the JCR are compiled annually from the current year's combined database, regardless of what kind of article was cited or when the cited article was published. Each unique article-to-article link is counted as a citation. For example, a single article may give 40 references, but if only 35 different articles are cited in those 40 references, it is the 35 unique citations that are distributed among the cited journals.

The number of publications, or source items, given for journals listed in the JCR include only original research articles, review articles, and technical notes. Editorials, letters, news items, and meeting abstracts are not counted as source items because they are not generally cited. Two notable exceptions are *FASEB Journal* and *Clinical Research*. These journals publish meeting abstracts in quantities large enough to account for a sizable percentage of the citations they receive each year. *Clinical Research* has changed its title to *Journal of Investigative Medicine*.

We have, in compiling the JCR, refrained from combining journal counts on the basis of 'lineage', except where a title change has been so minor that it does not affect the title's position alphabetically. Nor does the JCR combine counts for 'sections' of the 'same' journal. It is up to the user to decide whether or not one's purpose recommends that counts be combined. Listings of journal title changes for the past two years are given on page 19. Citations are unified in the case of journals that publish both an original language edition and a cover-to-cover translation. These journals are marked with a plus sign (+).

A reasonable effort is made to include a full year's issues for journals covered in the SCI/SSCI/A&HCI database. However, it is necessary for material to be processed by mid-February each year for inclusion in the JCR.

---

## Using the JCR Wisely

ISI does not recommend that JCR users depend solely on citation data in their journal evaluation. Citation data are not meant to replace informed peer review. Additionally, careful attention should be paid to the many conditions that can influence citation rates, such as language, journal history and format, publication schedule, and subject specialty. Users should also be aware of conditions that can affect the JCR journal rankings and impact factors. Four such conditions are discussed below.

**Impact factor by article type.** ISI manually codes each published source item, but it is not feasible to individually code the 12 million references processed each year. Therefore, citation counts in the JCR do not distinguish between letters, reviews, or original research articles even though article counts in the JCR include only original research articles, review articles, and technical notes or short articles. If a journal publishes a large number of letters one year there may be a temporary increase in the number of citations received. This increase will not be proportionately reflected in the JCR article count given. To identify and evaluate any such phenomena detailed article-by-article analyses can be conducted.

---

**Changes in journal format.** Sudden changes in a journal's size can affect the impact factor. The average number of cites per article is lowered when there are more one-year old articles than two-year old articles because article citation rates tend to peak in the second year after publication. Likewise, when an article count drops the impact factor may rise temporarily. In the *Journal Rankings*, article counts for the current year and the two previous years are given so that any sudden changes can be noted.

**Title changes and impact factor.** In the first year after a title change, the new title is listed without an impact factor because the article count for the two preceding years used in impact factor calculation is zero. The superseded title is listed with a normal impact factor. One year later, the JCR® lists separate impact factors for the new title and for the superseded title. In this second year, the impact factor for a new title may be lower than expected because the article count includes only younger articles. Similarly, the impact factor for the superseded title may be higher than expected because it is based on only older articles. The user can total the cites to the two previous years and divide that by the sum of the article counts for the two titles to calculate a unified Impact factor. Listings of titles changes, where both the new title and the superseded title appear in the JCR, are provided on page 19. In the third year after a title change, the superseded title is no longer listed.

**Cited-only journals in the JCR.** Some of the journals listed in the JCR are not citing journals, but are cited-only journals. This is significant when comparing journals because self-citations from cited-only journals are not included in the JCR data. Self-citations often represent a significant portion of the citations that a journal receives. The cited-only journals may be ceased or suspended journals, or superseded titles. Users can identify cited-only journals by checking the *Citing Journal Listing*. Any journal that appears elsewhere in the JCR, but not in the *Citing Journal Listing* is a cited-only journal.

## Statistical Summary

The following 'quick reference', extracted from the *Journal Rankings*, is provided for the user's convenience.

**Table 1:**

## Components of the SCI® JCR®

The microfiche edition of the SCI JCR is made up of six data listings and an abbreviated to full journal title listing. The six data listings are: I. *Journal Rankings*; II. *Source Data Listing*; III. *Journal Half-Life Listing*; IV. *Subject Category Listing*; V. *Citing Journal Listing*; and VI. *Cited Journal Listing*. Key figures from the *Journal Rankings* as well as the complete *Journal Title Abbreviations* and the *Subject Category Listing* are printed at the end of this Guide. See the *Displays and Descriptions* for more information on each data listing.

- |        |  |
|--------|--|
| ORANGE | <p>Card 1      The <i>Journal Title Abbreviations</i> provides full titles for the abbreviated titles of journals that are covered in the JCR.</p> <p>Cards 2-4      The <i>Journal Rankings</i> lists the science journals that are covered in the SCI and <i>Current Contents</i>® in six sections. The first section gives journals in alphabetic order. The next five sections rank the journals by five different indicators.<br/>Purpose: to provide citation data for individual journals and to determine overall rank.</p> <p>Card 5      The <i>Source Data Listing</i> gives both the number of articles published by each SCI source journal and the total number of references that those articles contained.<br/>Purpose: to show the citation activity generated by individual journals.</p> <p>Cards 6-7      The <i>Journal Half-Life Listing</i> shows the chronological distribution of journal usage in three sections.<br/>Purpose: to provide information on the currency or longevity of journals.</p> <p>Card 8      The <i>Subject Category Listing</i> groups journal titles by subject categories. Within each category the journals are ranked by impact factor.<br/>Purpose: to show a journal's standing within its field.</p> |
| WHITE  | <p>Cards 1-21      The <i>Citing Journal Listing</i> links each SCI and CMC/® journal with the journals it cited and the chronological distribution of items cited.<br/>Purpose: to provide detail on the activity of citing journals.</p>   |
| YELLOW | <p>Cards 1-17      The <i>Cited Journal Listing</i> links the science journals cited in the ISI® database with the journals that cite them and the chronological distribution of cited items. Main entries are limited to covered journals.<br/>Purpose: to provide detail on the usage of cited journals.</p>   |

---

# Definitions

<b>Citation</b>	When one document (A) mentions or refers to another document (B), the latter has been cited by the former as a source of information, as support for a point of view, as authority for a statement of fact, etc. The term 'citation' is used to indicate not only the fact that document B has been cited in a reference of document A, but also the description of document B contained in the reference. In this sense, citation and reference are frequently used interchangeably.
<b>Citation Index</b>	The <i>Citation Index</i> is an alphabetic list, by first author, of items cited in references from footnotes or bibliographies of a source article. Each such citation is followed by a short bibliographic description of the source article which contained the cited reference.
<b>Cited Half-Life</b>	The number of journal publication years going back from the current year which account for 50% of the total citations received by the cited journal in the current year.
<b>Cited Journal</b>	A science journal cited by any journal in the ISI® database. A cited journal is not necessarily a source journal covered by SCI®, SSCI® or A&HCI®. The <i>Cited Journal Listing</i> may also include as cited 'journals' non-journal serial publications. The main entries are limited to covered journals.
<b>Citing Half-Life</b>	The number of journal publication years going back from the current year which account for 50% of the total citations given by the citing journal in the current year.
<b>Citing Journal</b>	A citing journal is any journal covered in the combined ISI database. The <i>Citing Journal Listing</i> is limited to journals covered in the SCI and CMCI®.
<b>Immediacy Index</b>	The average number of times current articles in a specific journal were cited during the year they were published. In the JCR® current articles are those published in the JCR cover year. An article published early in the year has a better chance of being cited that year than one published later in the year.
<b>Impact Factor</b>	The average number of times recent articles in a specific journal were cited in the JCR cover year. For JCR impact factors recent articles are those published in the two years preceding the JCR cover year. There are other ways of calculating journal impact (see Garfield E. Citation analysis as a tool in journal evaluation. <i>Science</i> 178:471-79, 1972).  The impact factor is useful in understanding the significance of absolute citation frequencies. It tends to discount the advantage of large journals over small ones, of frequently issued journals over less frequently issued ones, and of older journals over newer ones. In each such case the first is likely to produce or have produced a larger citable body of literature than the second. All things being equal, the larger that body, the more often a journal will be

---

cited. By providing some qualification of the quantitative data in the JCR®, the impact factor is an important tool for journal evaluation.

<b>Journal Title</b>	In the JCR, periodical titles are usually abbreviated. The JCR abbreviations exclude subtitles and title run-ons. In alphabetic listing of journals, abbreviations are alphabetized letter by letter, with a space regarded as a 'letter' preceding A and a hyphen as a 'letter' preceding A but following a space. For example, J ZOOL will precede JPN HEART J and MED SCI LAW will precede MED-RIV ENC MED ITAL, while X-RAY SPECTROM will precede XENOBIOTICA.
<b>Reference</b>	The mention or description of one document (A) in another document (B), to indicate a source of information, to provide support for a point of view, to lend authority to some statement of fact, etc. Document B is said to make reference to document A; document A is said to be cited by document B. Reference is also used for the document description or bibliographic data given in making the reference. References are given in footnotes and in bibliographic listings at the end of an article. From such references are extracted the citations which become main-entries in the <i>Citation Index</i> .
<b>Self-Citation</b>	Self-citation of journals occurs when an article in a journal cites another article previously or simultaneously published in the same journal.
<b>Self-Citation Rate</b>	Self-citations expressed as a percentage of all citations. There are two self-citation rates, the self-citing and the self-cited rates. The self-citing rate relates a journal's self-citations to the total references it makes. For example, journal X made references to 10,000 items, including 2,000 of its own articles. Its self-citing rate is 2/10 or 20%. The self-cited rate relates a journal's self-citations to the number of times it is cited by all journals including itself. For example, journal X was cited 15,000 times by all journals, including 2,000 times it cited itself. Its self-cited rate is 2/15 or 13.3%. A journal's self-citation rate may indicate several things about its field: a high self-citation rate may mean that the field is small or isolated. Multidisciplinary journals tend to have low self-citation rates.
<b>Source Index</b>	The Source Index of the SCI®, SSCI® or A&HCI® gives a complete bibliographic description of all source items processed for the SCI, SSCI or A&HCI during a year. Items are arranged alphabetically by name of first author; co-authors are cross-referenced to first authors.
<b>Source Item</b>	Source item generally refers to an item published in any journals processed for coverage in a citation index. In the JCR, however, only original research articles and review articles are counted for all listed journals.
<b>Source Journal</b>	This is a journal that is covered in the SCI, SSCI or A&HCI, so called because it is the source of published items processed for compilation of the four sections of the citation indexes. In the JCR a source journal is a citing journal.
<b>Times Cited: Articles</b>	As elsewhere in these definitions, the term 'articles' is used broadly for journal items, and includes technical communications, letters to the editor, editorials, etc. An article cited three times in the references of the same SCI source item is counted as having been cited by that source item once. Thus, 'times

---

'cited' in the case of articles is the cumulative number of times the article has been cited once or more by all source items.

**Times Cited:  
Authors** In the case of authors, 'times cited' is the sum of the citations of their cited items, as described above, including journal articles, books, etc.

**Times Cited:  
Journals** In the case of journals, 'times cited' is a cumulation of the number of times a specific journal has been named in the different articles referenced by the source items processed for the SCI®/SSCI®/A&HCI® database.

**+ (plus sign):** A plus sign appears following some journal titles to indicate that citation counts for cover-to-cover translations and original language versions of the journal have been combined.

**• (small bullet):** A small bullet appears only in the Journal Rankings. It indicates that complete source data were not available for a particular journal before the final JCR® processing deadline.

---

## **KEY FIGURES FROM THE JOURNAL RANKINGS**

This listing gives journal titles in alphabetic order with total citations, impact factor, immediacy index, and source items.

## **SUBJECT CATEGORY LISTING**

This listing gives journals ranked by impact factor within subject categories in Section 1 and a journal to category cross-reference in Section 2.

**SCI JOURNAL CITATION REPORTS**

**IV. SUBJECT CATEGORY LISTING 1996**

SECTION-1

**JOURNALS RANKED BY IMPACT FACTOR WITHIN CATEGORY**
